Operational Safety:

**WARNING**

Operation of electronic equipment involves the use of voltages and currents that may be dangerous to human life. Note that under certain conditions dangerous potentials may exist in some circuits when power controls are in the OFF position. Maintenance personnel should observe all safety regulations.

Do not make any adjustments inside equipment with power ON unless proper precautions are observed. All internal adjustments should only be made by suitably qualified personnel. All operational adjustments are available externally without the need for removing covers or use of extender cards.

---

**Optical Safety**

The light emitted from the LASER diode used in this system is invisible and may be harmful to the human eye. Avoid looking directly into the fibre optic cable or connectors or into the collimated beam along their axis when the device is in operation. Operating the LASER diode outside of its maximum ratings may cause device failure or a safety hazard.

---

**DANGER**

Invisible LASER radiation-
Avoid direct exposure to beam

AVT-3070/xxx & AVR-3070/xxx

Analogue Video Fibre Optic Link

(/xxx = /APC or /PC)

General Description

The IRT AVT-3070 / AVR-3070 analogue video fibre optic link provides a channel bandwidth of 14 MHz allowing for a 6 MHz bandwidth video signal plus addition of several audio or data signals on subcarriers between 7 and 12 MHz.

The video signal is handled directly by the AVT-3070 and AVR-3070 modules. Additional signals are added using a subcarrier mixing input on the AVT-3070 and are extracted from a subcarrier output on the AVR-3070. Separate modules are available to modulate and demodulate subcarrier signals for stereo audio and data.

The use of fibre optic cable provides low signal attenuation with no gain or cable equalisation requirements and the added benefit of immunity to RFI and EMI and protection against lightning strikes.

The system uses single mode fibre (9/125µm) operating in the 1300 nm window with an allowable path loss of up to 24 dB. The operating distance depends upon the actual cable and connector losses.

AVT-3070 LASER transmitter

The AVT-3070 Transmitter uses a 1300 nm LASER diode with a launch power of between -7 and -10 dBm. The 6 MHz LPF can be by-passed to allow full use of the channel bandwidth of 14 MHz.

A LASER power alarm and LED indicator are provided.

If preferred, a 1500 nm LASER is available on request.

AVR-3070 PINTIA detector receiver

This receiver contains an PINTIA Diode detector, which allows for a 24 dB path loss. The detected optical signal is demodulated and the audio & data subcarriers split. The signal is then passed through a 6.0 MHz LPF to recover the base band video signal.

Outputs are on the rear assembly of the module with a monitoring output on the front panel.

Alarms and LED’s to indicate optical carrier failure and video failure are provided.

Modules may be installed in an IRT 1 RU or 3 RU Eurocard frames. The modules may be categorised as follows:

Applications:

- Single channel broadcast quality analogue video link.
- Meets full broadcast CCIR or RS 250C Medium Haul Specifications up to a 24 dB optical path loss.
- Audio & data channels can be carried above the video channel

Fibre optic link benefits include:

- Immunity from RFI.
- Low signal attenuation.
- Lightning immunity.
- Electrical isolation eliminates ground loop problems.
- Elimination of equalisers & amplifiers over the link path.
### System Examples

Technical Specifications

NOTE: All performance figures are for Optical Path losses of 24 dB.

**Video:** (Link performance)
- Input & output connectors: BNC.
- Specified input level: 1 Vp-p (Luminance).
- Input / output impedance: 75 Ω.
- Input signal: Composite PAL / NTSC or MAC style signal.
- Noise (To CCIR Rec. 567-1): < -63 dBm.
- Overall gain (adjustable from front panel): < Unity ±3 dB.
- Frequency response: ±0. 1 dB to 5 MHz.
- Path loss: ±0. 5 dB to 10 MHz (no audio).
- Differential gain at 4. 43 MHz (3. 58 MHz): <1. 0%.
- Differential phase at 4. 43 MHz (3. 58 MHz): |<1. 0°.
- Pulse to bar K-factor: <=0. 5%K.
- Luminance/chrominance inequality: Delay <20 ns.
- Gain <2%.

**Optical:**
- Input & output connectors: SC/PC or SC/APC (specify when ordering).
- LASER: Wavelength: 1300 nm.
- Launch power: -7 to -10 dBm - single mode (9/125 µm) cable.
- Path loss: Up to 24 dB to meet published specifications.

**Other:**
- Temperature range: 0 - 50° C ambient.
- Power requirements: 28 Vac CT (14-0-14) or ±16 Vdc.
- Mechanical: Suitable for mounting in IRT 19” rack chassis with optical, RF & alarm connections at the rear.
- Finish : Front panel: Grey enamel, silk-screened black lettering & red IRT logo.
- Rear assembly: Detachable silk-screened PCB with direct mount connectors to Eurocard and external signals.
- Dimensions: 6 HP x 3 U x 220 mm IRT Eurocard.
- Supplied accessories: AVT-3070 and AVR-3070 rear connector assembly.
- Related modules: AAT-3140 & AAR-3140 stereo audio subcarrier modulator / demodulator.

NOTE: All the parameters specified are only applicable when using single mode (9/125 µm) fibre cable.

Due to our policy of continuing development, these specifications are subject to change without notice.
Technical Description

A detailed circuit description is beyond the scope of this manual. The following description is intended to give the user only a basic understanding of the principles involved. If detailed information is required for servicing purposes, please contact the factory.

Please refer to the diagrams provided at the rear of this manual as noted:

**AVT-3070**: (dwg: 803801)

The video input is equalised and amplified. Although the system is capable of a full 14 MHz bandwidth, frequencies above 5.5 MHz are not normally required for visual information. Frequencies above this are normally used for carrying supplementary signals by the use of subcarriers.

In order to provide a clean signal for the inclusion of subcarriers, the video signal is passed through a low pass filter. The Faraday filter used is a plug in type and may be bypassed if full 14 MHz bandwidth is required for the video signal.

Subcarriers for the audio channels are generated in separate modules for addition to the video signal. See separate manual for details.

The video and the audio subcarriers are then pre-emphasised and back porch clamped. The resultant signal is used to modulate a wide band modulator, which has excellent linearity over the full modulation bandwidth. The modulator frequency, without deviation, is approximately 30 MHz.

The modulated signal then drives the low powered LASER. The optical power output is set to -10 dBm and connected to the external fibre cable via an SC fibre optic connector.

**AVR-3070**: (dwg: 804588)

The optical signal received at the receiver is connected to a PINTIA diode. The signal detected by the photodiode is then amplified and fed to an AGC amplifier, which maintains a constant RF output level over the received optical signal range. The signal is then fed to a limiter and demodulator.

The output from the discriminator is band limited to 14 MHz. It is then amplified and de-emphasised to provide a full bandwidth video signal containing both video signal and audio subcarriers.

The video signal is split to provide a subcarrier output for de-modulation of audio and or data signals in their separate modules.

The video signal is low pass filtered to remove any subcarriers and passed to the video output via the mute switch.
Configuration & Controls

Operational Adjustments

**AVT-3070**

**Input Gain.**
The video input level has been factory aligned for a 1 Vp-p video signal at the input to the AVT-3070. The signal level to the AVT-3070 must be properly set for the video channel noise and linearity specifications to be met. Therefore if the video level into the AVT-3070 is different, the gain should be adjusted so that the VID. MON. output is 1 Vp-p.

**Cable Equalisation.**
If a long run of cable is used to feed the input to the transmitter then the EQ. should be adjusted to give a properly equalised video signal at the VIDEO MON. output on the AVT-3070.

**AVR-3070**

**Output Gain:** The GAIN on the AVR-3070 front panel should be adjusted so that the video signal at the VIDEO MON. output is 1 Vp-p.

**AUDIO**
The AVT-3070 & AVR-3070 support the inclusion of audio or data signals on suitable subcarriers of the video signal. See separate manuals for details of these modulators and de-modulators.

Internal Adjustments

The following adjustable controls are factory set and should not be adjusted. They are not 'operational' controls. Correct adjustment requires the use of calibrated standards and must be carried out in correct sequence.

Any adjustment by the user is likely to, at best, degrade the performance and make the module incompatible with other modules or systems.

The following list of controls is for information purposes ONLY as an aid to understanding the principles of the transmission system.

Some controls and components are deliberately omitted from production units; provision for these on the PCB is for factory test purposes and custom configurations.

**AVT-3070**

- C 4  Video frequency response.
- C 6  Video frequency response.
- C 8  Video frequency response.
- C 10 Video frequency response.
- C 12 Video frequency response.
- C 29 Not used.
- C 35 Pre-emphasis.
- C 40 Video frequency response.
- C 43 Carrier centre frequency. *

**RV**

- RV 1 Input cable equalisation. (Front panel adjustment)
- RV 2 Input common mode.
- RV 3 Video output level. (Front panel adjustment)
- RV 4 Not used
- RV 5 Blanking frequency adjustment. *
- RV 6 Modulation linearity. *
- RV 7 2nd harmonic null. *
- RV 8 LASER drive. *
- RV 9 LASER temperature. *
- RV 10 LASER power control. *
- RV 11 High power alarm reference.
- RV 12 Low power alarm reference.

* Critical adjustment - DO NOT ADJUST.

**LK**

- LK 1 Video clamp on/off Clamped: link out.
  Not clamped: link installed.
- LK 2 Pre-emphasis on/off - normally linked.
**Wideband operation:**

Where no audio is to be used the AVT-3070 may be set for full video bandwidth output (≈14 MHz) as follows:

1. Remove the Faraday low pass filter from its DIL socket.
2. Insert a dummy DIL header into the socket with pin 1 connected to pin 20.
3. Re-adjust front panel video gain for 1 Vp-p at VIDEO MON. socket on front panel.

Note that for this to be effective the same modification must be made to the connected receiver module.

**AVR-3070**

- C 31 Not used
- C 107 Video frequency response.

**RV**

- RV 1 AGC level.
- RV 2 Video output level (Front Panel Adjustment)
- RV 3 Carrier 2nd harmonic balance. *
- RV 4 DC offset null.
- RV 5 Not used
- RV 6 Video frequency response.
- RV 7 De-emphasis EQ 1.
- RV 8 De-emphasis EQ 2.
- RV 9 Video pre-set gain.

**LK**

- LK 1 Receive loss alarm disable - normally linked.
- LK 2 Video clamp on/off Clamped: link out Not clamped: link installed
- LK 3 Audio subcarrier out - normally linked.
- LK 4 De-emphasis on/off - normally linked.

* Critical adjustment - DO NOT ADJUST.

**Wideband operation:**

Where no audio is to be used the AVR-3070 may be set for full video bandwidth output (≈14 MHz) as follows:

1. Remove the Faraday low pass filter from its DIL socket.
2. Insert a dummy DIL header into the socket with pin 1 connected to pin 20.
3. Re-adjust front panel video gain for 1 Vp-p at VIDEO MON. socket on front panel.
4. Remove link LK 3 to disable S/C output signal.

Note that for this to be effective the same modification must be made to the connected transmitter module.

**Monitor points and indicators:**

There are a number of indicators on the AVT-3070 series that can aid fault detection:

**ALL Modules:**

DC green LED indicates the presence of ±12V on each module as appropriate.

**AVR-3070:**

RX LOSS red LED indicates that the received carrier level is not present or below the range of the AGC.

VID. FAIL red LED indicates the absence of video on the demodulator output.
Installation

Pre-installation:

Handling:

This equipment may contain or be connected to static sensitive devices and proper static free handling precautions should be observed.

Where individual circuit cards are stored, they should be placed in antistatic bags. Proper antistatic procedures should be followed when inserting or removing cards from these bags.

Power:

AC mains supply: Ensure that operating voltage of unit and local supply voltage match and that correct rating fuse is installed for local supply.

DC supply: Ensure that the correct polarity is observed and that DC supply voltage is maintained within the operating range specified.

Earthing:

The earth path is dependent on the type of frame selected. In every case particular care should be taken to ensure that the frame is connected to earth for safety reasons. See frame manual for details.

Signal earth: For safety reasons a connection is made between signal earth and chassis earth. No attempt should be made to break this connection.

Installation in frame or chassis:

See also details in separate manual for selected frame type.

Warning

Optical Connections

The optical connectors on the AVT-3070 & AVR-3070 are attached to the main module PCB, NOT the rear connector assembly.

When installing the optical fibre sufficient slack should be allowed for the module to be withdrawn with the optical fibre attached until the connector is clear of the frame and can be disconnected.

If this is not done, the module will not be able to be removed without first disconnecting the optical fibre at the rear. Attempting to remove the module without first disconnecting the fibre may result in damage to the fibre and / or the module.
Front and rear panel diagrams.

The following drawings are not to scale and are intended to show relative positions of controls, indicators and connectors only.
**Inter-module connections:**

See interconnection diagram following.

**Audio muting:**

The AAR-3140 dual audio de-modulator is provided with a muting input on PL 3, which may be used to mute the output audio when no video carrier is present.

To enable this function PL 3 on the AAR-3140 must be connected to PL 4 on the AVR-3070.

PL 4 on the AAR-3140 provides a loop through of this connection for use by another AAR-3140 where more than two channels of audio are fitted.

Note:

PL 3 & PL 4 on the AAT-3140 need not be connected and are included only for compatibility with previous systems.

**Subcarriers: (S/C in & S/C out)**

Audio and data signals that are required to be carried on the link are first modulated onto subcarrier frequencies between 6.5 MHz and 12 MHz. For actual subcarrier frequencies used, consult the manual for the appropriate modules.

Each audio or data module provides a S/C out connection, which is adjusted to a suitable level for addition to the video signal.

The S/C in connection on the AAT-3140 provides a means of adding subcarriers from other modules to those of the AAT-3140 so that only one S/C input is required on the AVT-3070. The converse connections apply at the receive end of the link with the AVR-3070 and AAR-3140’s.

Connection of the subcarriers may be made using the accessory cable type GVW-3011 (150 mm BNC – BNC) where the modules are located side by side in a 3 RU frame or GVW-3012 (300 mm BNC – BNC) for 1 RU frames.

Maintenance & storage

Maintenance:

No regular maintenance is required.

Care however should be taken to ensure that all connectors are kept clean and free from contamination of any kind. This is especially important in fibre optic equipment where cleanliness of optical connections is critical to performance.

Storage:

If the equipment is not to be used for an extended period, it is recommended the whole unit be placed in a sealed plastic bag to prevent dust contamination. In areas of high humidity a suitably sized bag of silica gel should be included to deter corrosion.

Where individual circuit cards are stored, they should be placed in antistatic bags. Proper antistatic procedures should be followed when inserting or removing cards from these bags.

Warranty & Service

Equipment is covered by a limited warranty period of three years from date of first delivery unless contrary conditions apply under a particular contract of supply. For situations when “No Fault Found” for repairs, a minimum charge of 1 hour’s labour, at IRT’s current labour charge rate, will apply, whether the equipment is within the warranty period or not.

Equipment warranty is limited to faults attributable to defects in original design or manufacture. Warranty on components shall be extended by IRT only to the extent obtainable from the component supplier.

Equipment return:

Before arranging service, ensure that the fault is in the unit to be serviced and not in associated equipment. If possible, confirm this by substitution.

Before returning equipment contact should be made with IRT or your local agent to determine whether the equipment can be serviced in the field or should be returned for repair.

The equipment should be properly packed for return observing antistatic procedures.

The following information should accompany the unit to be returned:

1. A fault report should be included indicating the nature of the fault
2. The operating conditions under which the fault initially occurred.
3. Any additional information, which may be of assistance in fault location and remedy.
4. A contact name and telephone and fax numbers.
5. Details of payment method for items not covered by warranty.
6. Full return address.
7. For situations when “No Fault Found” for repairs, a minimum charge of 1 hour’s labour will apply, whether the equipment is within the warranty period or not. Contact IRT for current hourly rate.

Please note that all freight charges are the responsibility of the customer.

The equipment should be returned to the agent who originally supplied the equipment or, where this is not possible, to IRT direct as follows.
